

Technogenia's Environmental Policy Statement

Our company is actively committed to minimizing the negative impact our processes can have on the environment.

The Managing Director and senior management are responsible for developing the environmental policy and monitoring progress.

We ensure that all our employees are aware of this policy and strive to meet its requirements.

Technogenia has been calculating its carbon footprint since 2019, and it has been recalculated every year since then.

We have set ourselves targets for reducing our carbon footprint:

We recognize that all our activities have an impact on the environment and that potentially negative effects must be identified and minimized. We are committed to reducing our total Scope 1 and 2 emissions by 42% by 2030, compared with the baseline year of 2022.

This corresponds to an annual tCO₂e reduction of 5.3%.

We are actively committed to reducing our environmental impact by adapting our working methods.

Where technological advances allow, we incorporate those that reduce our consumption of energy and raw materials.

We optimize the composition of our coatings to limit their environmental impact.

We seek to continuously improve the environmental performance of our surfacing technologies.

Finally, we are working to optimize the ratio between reloading and service life to maximize climate benefits.
